

Novacom Private Cell Lines (PCL)

Replace your plain old telephone service (POTS) with cellular enabled fixed or mobile implementations.

PCL allows users to replace analog (copper) phone lines, also called POTS (plain old telephone service) or PSTN (public switched telephone network), with a cost-competitive effective cellular voice and data Micro Tower (MT). The MT converts your fixed location landline devices to cellular enabled fixed or mobile implementations. POTS Replacement with a PCL is the easiest way to switch legacy equipment from traditional phone landlines to a 4G LTE network. The existing analog device is connected directly to MT. Simply unplug the telephone jack from its wall outlet and plug it into the MT RJ11 socket. Insert the appropriate SIM card into the back panel of the unit.
